Production and Growth

PRINCIPLES OF

ECONOMICS

FOURTH EDITION

N. GREGORY MANKIW

PowerPoint® Slides
by Ron Cronovich

In this chapter, look for the answers to these questions:

- What are the facts about living standards and growth rates around the world?
- Why does productivity matter for living standards?
- What determines productivity and its growth rate?
- How can public policy affect growth and living standards?

A typical family with all their possessions in the U.K., an advanced economy

Real GDP per capita: \$30,800

Life expectancy: 78 years

Adult literacy: 99%

A typical family with all their possessions in Mexico, a middle income country

Real GDP per capita: \$9,800

Life expectancy: 74 years

Adult literacy: 92%

A typical family with all their possessions in Mali, a poor country

Real GDP per capita:	\$1,000
Life expectancy:	41 years
Adult literacy:	46%

Incomes and Growth Around the World

FACT 1:

There are vast differences in living standards around the world.

	<i>GDP per capita, 2004</i>	<i>Growth rate, 1960-2004</i>
China	\$5,495	5.6%
Singapore	27,273	5.4%
Japan	29,539	3.9%
Spain	25,341	3.2%
Israel	24,082	2.6%
India	3,115	2.5%
United States	39,618	2.2%
Canada	31,129	2.1%
Colombia	7,121	1.8%
New Zealand	22,912	1.4%
Philippines	4,558	1.3%
Argentina	12,723	0.8%
Saudi Arabia	14,022	0.8%
Rwanda	1,326	0.2%
Haiti	1,685	-1.3%

Incomes and Growth Around the World

FACT 2:

There is also great variation in growth rates across countries.

	<i>GDP per capita, 2004</i>	<i>Growth rate, 1960-2004</i>
China	\$5,495	5.6%
Singapore	27,273	5.4%
Japan	29,539	3.9%
Spain	25,341	3.2%
Israel	24,082	2.6%
India	3,115	2.5%
United States	39,618	2.2%
Canada	31,129	2.1%
Colombia	7,121	1.8%
New Zealand	22,912	1.4%
Philippines	4,558	1.3%
Argentina	12,723	0.8%
Saudi Arabia	14,022	0.8%
Rwanda	1,326	0.2%
Haiti	1,685	-1.3%

Incomes and Growth Around the World

Since growth rates vary, the country rankings can change over time:

- Poor countries are not necessarily doomed to poverty forever – *e.g.*, Singapore, incomes were low in 1960 and are quite high now.
- Rich countries can't take their status for granted: They may be overtaken by poorer but faster-growing countries.

Incomes and Growth Around the World

Questions:

- Why are some countries richer than others?
- Why do some countries grow quickly while others seem stuck in a poverty trap?
- What policies may help raise growth rates and long-run living standards?

Productivity

- Recall one of the Ten Principles from Chapter 1: *A country's standard of living depends on its ability to produce g & s .*
- This ability depends on **productivity**: the average quantity of g & s produced per unit of labor input.
- Y = real GDP = quantity of output produced
 L = quantity of labor
so we can write productivity as Y/L (output per worker)

Why Productivity Is So Important

- When a nation's workers are very productive, real GDP is large and incomes are high.
- When productivity grows rapidly, so do living standards.
- What, then, determines productivity and its growth rate?

Physical Capital Per Worker

- Recall: The stock of equipment and structures used to produce g&s is called **[physical] capital**, denoted **K**.
- **K/L** = capital per worker.
- Productivity is higher when the average worker has more capital (machines, equipment, etc.).
- *i.e.*,
an increase in **K/L** causes an increase in **Y/L**.

Human Capital Per Worker

- **Human capital (H):**
the knowledge and skills workers acquire through education, training, and experience
- H/L = the average worker's human capital
- Productivity is higher when the average worker has more human capital (education, skills, etc.).
- *i.e.*,
an increase in H/L causes an increase in Y/L .

Natural Resources Per Worker

- **Natural resources** (**N**): the inputs into production that nature provides, e.g., land, mineral deposits
- Other things equal,
more **N** allows a country to produce more **Y**.
In per-worker terms,
an increase in **N/L** causes an increase in **Y/L**.
- Some countries are rich because they have abundant natural resources
(e.g., Saudi Arabia has lots of oil)
- But countries need not have much **N** to be rich
(e.g., Japan imports the **N** it needs).

Technological Knowledge

- **Technological knowledge:** society's understanding of the best ways to produce g&s
- Technological progress does not only mean a faster computer, a higher-definition TV, or a smaller cell phone.
- It means any advance in knowledge that boosts productivity (allows society to get more output from its resources).
 - e.g., Henry Ford and the assembly line.

Tech. Knowledge vs. Human Capital

- Technological knowledge refers to society's understanding of how to produce g&s.
- Human capital results from the effort people expend to acquire this knowledge.
- Both are important for productivity.

The Production Function

- The production function is a graph or equation showing the relation between output and inputs:

$$Y = A F(L, K, H, N)$$

$F()$ – a function that shows how inputs are combined to produce output

“ A ” – the level of technology

- “ A ” multiplies the function $F()$, so improvements in technology (increases in “ A ”) allow more output (Y) to be produced from any given combination of inputs.

The Production Function

$$Y = A F(L, K, H, N)$$

- The production function has the property **constant returns to scale**: Changing all inputs by the same percentage causes output to change by that percentage. For example,
- Doubling all inputs (multiplying each by 2) causes output to double:

$$2Y = A F(2L, 2K, 2H, 2N)$$

- Increasing all inputs 10% (multiplying each by 1.1) causes output to increase by 10%:

$$1.1Y = A F(1.1L, 1.1K, 1.1H, 1.1N)$$

The Production Function

$$Y = A F(L, K, H, N)$$

- If we multiply each input by $1/L$, then output is multiplied by $1/L$:

$$Y/L = A F(1, K/L, H/L, N/L)$$

- This equation shows that productivity (output per worker) depends on:
 - the level of technology (**A**)
 - physical capital per worker
 - human capital per worker
 - natural resources per worker

ACTIVE LEARNING 1:

Discussion question

Which of the following policies do you think would be most effective at boosting growth and living standards in a poor country over the long run?

- a. offer tax incentives for investment by local firms
- b. ...by foreign firms
- c. give cash payments for good school attendance
- d. crack down on govt corruption
- e. restrict imports to protect domestic industries
- f. allow free trade
- g. give away condoms

ECONOMIC GROWTH AND PUBLIC POLICY

Next, we look at the ways
public policy can affect
long-run growth in productivity
and living standards.

Saving and Investment

- We can boost productivity by increasing K , which requires investment.
- Since resources scarce, producing more capital requires producing fewer consumption goods.
- Reducing consumption = increasing saving. This extra saving funds the production of investment goods. *(More details in the next chapter.)*
- Hence, a tradeoff between current and future consumption.

Diminishing Returns and the Catch-Up Effect

- The govt can implement policies that raise saving and investment. (*Details in next chapter.*) Then **K** will rise, causing productivity and living standards to rise.
- But this faster growth is temporary, due to **diminishing returns to capital**: As **K** rises, the extra output from an additional unit of **K** falls....

The Production Function & Diminishing Returns

If workers have little K , giving them more increases their productivity a lot.

If workers already have a lot of K , giving them more increases productivity fairly little.

The catch-up effect: the property whereby poor countries tend to grow more rapidly than rich ones

Example of the Catch-Up Effect

- Over 1960-1990, the U.S. and S. Korea devoted a similar share of GDP to investment, so you might expect they would have similar growth performance.
- But growth was $>6\%$ in Korea and only 2% in the U.S.
- Explanation: the catch-up effect.
In 1960, K/L was far smaller in Korea than in the U.S., hence Korea grew faster.

Investment from Abroad

- To raise K/L and hence productivity, wages, and living standards, the govt can also encourage
 - **Foreign direct investment:**
a capital investment (e.g., factory) that is owned & operated by a foreign entity.
 - **Foreign portfolio investment:**
a capital investment financed with foreign money but operated by domestic residents.
- Some of the returns from these investments flow back to the foreign countries that supplied the funds.

Investment from Abroad

- Especially beneficial in poor countries that cannot generate enough saving to fund investment projects themselves.
- Also helps poor countries learn state-of-the-art technologies developed in other countries.

Education

- Govt can increase productivity by promoting education—investment in human capital (**H**).
 - public schools, subsidized loans for college
- Education has significant effects: In the U.S., each year of schooling raises a worker's wage by 10%.
- But investing in **H** also involves a tradeoff between the present & future:
Spending a year in school requires sacrificing a year's wages now to have higher wages later.

Health and Nutrition

- Health care expenditure is a type of investment in human capital – healthier workers are more productive.
- In countries with significant malnourishment, raising workers' caloric intake raises productivity:
 - Over 1962-95, caloric consumption rose 44% in S. Korea, and economic growth was spectacular.
 - Nobel winner Robert Fogel:
30% of Great Britain's growth from 1790-1980 was due to improved nutrition.

Property Rights and Political Stability

- Recall: *Markets are usually a good way to organize economic activity.*
The price system allocates resources to their most efficient uses.
- This requires respect for **property rights**, the ability of people to exercise authority over the resources they own.

Property Rights and Political Stability

- In many poor countries, the justice system doesn't work very well:
 - contracts aren't always enforced
 - fraud, corruption often go unpunished
 - in some, firms must bribe govt officials for permits
- Political instability (e.g., frequent coups) creates uncertainty over whether property rights will be protected in the future.

Property Rights and Political Stability

- When people fear their capital may be stolen by criminals or confiscated by a corrupt govt, there is less investment, including from abroad, and the economy functions less efficiently. Result: lower living standards.
- Economic stability, efficiency, and healthy growth require law enforcement, effective courts, a stable constitution, and honest govt officials.

Free Trade

- **Inward-oriented policies** (e.g., tariffs, limits on investment from abroad) aim to raise living standards by avoiding interaction with other countries.
- **Outward-oriented policies** (e.g., the elimination of restrictions on trade or foreign investment) promote integration with the world economy.

Free Trade

- Recall: *Trade can make everyone better off.* 
- Trade has similar effects as discovering new technologies – it improves productivity and living standards.
- Countries with inward-oriented policies have generally failed to create growth.
 - e.g., Argentina during the 20th century.
- Countries with outward-oriented policies have often succeeded.
 - e.g., South Korea, Singapore, Taiwan after 1960.

Research and Development

- Technological progress is the main reason why living standards rise over the long run.
- One reason is that knowledge is a **public good**: Ideas can be shared freely, increasing the productivity of many.
- Policies to promote tech. progress:
 - patent laws
 - tax incentives or direct support for private sector R&D
 - grants for basic research at universities

Population Growth

...may affect living standards in 3 different ways:

1. Stretching natural resources

- 200 years ago, Malthus argued that pop. growth would strain society's ability to provide for itself.
- Since then, the world population has increased sixfold. If Malthus was right, living standards would have fallen. Instead, they've risen.
- Malthus failed to account for technological progress and productivity growth.

Population Growth

2. Diluting the capital stock

- more population = higher **L** = lower **K/L**
= lower productivity & living standards.
- This applies to **H** as well as **K**:
fast pop. growth = more children
= greater strain on educational system.
- Countries with fast pop. growth tend to have lower educational attainment.

Population Growth

2. Diluting the capital stock

To combat this, many developing countries use policy to control population growth.

- China's one child per family laws
- contraception education & availability
- promote female literacy to raise opportunity cost of having babies

Population Growth

3. Promoting tech. progress

- More people
 - = more scientists, inventors, engineers
 - = more frequent discoveries
 - = faster tech. progress & economic growth
- Evidence from Michael Kremer:
Over the course of human history,
 - growth rates increased as the world's population increased
 - more populated regions grew faster than less populated ones

ACTIVE LEARNING 2:

Productivity

- List the determinants of productivity.
- List three policies that attempt to raise living standards by increasing one of the determinants of productivity.

ACTIVE LEARNING 2:

Answers

Determinants of productivity:

physical capital per worker (K/L)
human capital per worker (H/L)
natural resources per worker (N/L)
technological knowledge (A)

Policies to boost productivity:

- Encourage saving and investment, to raise K/L
- Encourage investment from abroad, to raise K/L
- Provide public education, to raise H/L

ACTIVE LEARNING 2:

Answers

Determinants of productivity:

- physical capital per worker (K/L)
- human capital per worker (H/L)
- natural resources per worker (N/L)
- technological knowledge (A)

Policies to boost productivity:

- Patent laws or grants, to increase A
- Control population growth, to increase K/L

Are Natural Resources a Limit to Growth?

- Some argue that population growth is depleting the Earth's non-renewable resources, and thus will limit growth in living standards.
- But technological progress often yields ways to avoid these limits:
 - Hybrid cars use less gas.
 - Better insulation in homes reduces the energy required to heat or cool them.
- As a resource becomes scarcer, its market price rises, which increases the incentive to conserve it and develop alternatives.

CONCLUSION

- In the long run, living standards are determined by productivity.
- Policies that affect the determinants of productivity will therefore affect the next generation's living standards.
- One of these determinants is saving and investment.
- In the next chapter, we will learn how saving and investment are determined, and how policies can affect them.

CHAPTER SUMMARY

- There are great differences across countries in living standards and growth rates.
- Productivity (output per unit of labor) is the main determinant of living standards in the long run.
- Productivity depends on physical and human capital per worker, natural resources per worker, and technological knowledge.
- Growth in these factors – especially technological progress – causes growth in living standards over the long run.

CHAPTER SUMMARY

- Policies can affect the following, each of which has important effects on growth:
 - saving and investment
 - international trade
 - education, health & nutrition
 - property rights and political stability
 - research and development
 - population growth
- Because of diminishing returns to capital, growth from investment eventually slows down, and poor countries may “catch up” to rich ones.
